

Iterative methods for systems of linear equations

$$\mathbf{Ax} = \mathbf{b}, \quad \mathbf{x} \in \mathbb{R}^m, \mathbf{b} \in \mathbb{R}^m, \mathbf{A} \text{ is } m \times m$$

Jacobi iteration: $\mathbf{D}\mathbf{x}^{(n+1)} + (\mathbf{L} + \mathbf{U})\mathbf{x}^{(n)} = \mathbf{b}$

Seidel's iteration: $\mathbf{D}\mathbf{x}^{(n+1)} + \mathbf{L}\mathbf{x}^{(n+1)} + \mathbf{U}\mathbf{x}^{(n)} = \mathbf{b}$

S.O.R.: $\mathbf{D}\mathbf{x}^{(n+1)} = (1 - \omega)\mathbf{D}\mathbf{x}^{(n)} + \omega(-\mathbf{L}\mathbf{x}^{(n+1)} - \mathbf{U}\mathbf{x}^{(n)} + \mathbf{b})$

Canonical form of iterative methods

A *canonical form* of a single-step method of solving

$$\mathbf{Ax} = \mathbf{b}$$

is defined by $\mathbf{P}_{n+1} \in \mathbb{R}^{m,m}$ and $\tau_{n+1} \in \mathbb{R}$:

$$\mathbf{P}_{n+1} \frac{\mathbf{x}^{(n+1)} - \mathbf{x}^{(n)}}{\tau_{n+1}} + \mathbf{Ax}^{(n)} = \mathbf{b}$$

Canonical form of iterative methods

A *canonical form* of a single-step method of solving

$$\mathbf{Ax} = \mathbf{b}$$

is defined by $\mathbf{P}_{n+1} \in \mathbb{R}^{m,m}$ and $\tau_{n+1} \in \mathbb{R}$:

$$\mathbf{P}_{n+1} \frac{\mathbf{x}^{(n+1)} - \mathbf{x}^{(n)}}{\tau_{n+1}} + \mathbf{Ax}^{(n)} = \mathbf{b}$$

- ▶ If $\mathbf{P}_{n+1} = \mathbf{P}$ and $\tau_{n+1} = \tau$ are n -independent, the method is *stationary*
- ▶ If $\mathbf{P} = \hat{\mathbf{1}}$, the method is *explicit*.

Iterative methods for systems of linear equations

For an explicit method, the iteration is

$$\mathbf{x}^{(n+1)} = \mathbf{x}^{(n)} + \tau_{n+1} \left[\mathbf{b} - \mathbf{A}\mathbf{x}^{(n)} \right]$$

For an implicit method, we have to solve an additional system of equations at each step:

$$\mathbf{P}_{n+1}\mathbf{x}^{(n+1)} = \mathbf{P}_{n+1}\mathbf{x}^{(n)} + \tau_{n+1} \left[\mathbf{b} - \mathbf{A}\mathbf{x}^{(n)} \right]$$

In practice

- ▶ Compute the residual $\mathbf{r}^{(n)} = \mathbf{b} - \mathbf{A}\mathbf{x}^{(n)}$
- ▶ Solve $\mathbf{P}_{n+1}\mathbf{z} = \mathbf{r}^{(n)}$
- ▶ Then $\mathbf{x}^{(n+1)} = \mathbf{x}^{(n)} + \tau_{n+1}\mathbf{z}$

Canonical form of iterative methods

Jacobi iteration

$$\mathbf{D}\mathbf{x}^{(n+1)} - \mathbf{D}\mathbf{x}^{(n)} + \underbrace{\mathbf{D}\mathbf{x}^{(n)} + (\mathbf{L} + \mathbf{U})\mathbf{x}^{(n)}}_{\mathbf{Ax}^{(n)}} = \mathbf{b}$$

$$\Rightarrow \quad \mathbf{P} = \mathbf{D} \text{ and } \tau = 1$$

Canonical form of iterative methods

Jacobi iteration

$$\mathbf{D}\mathbf{x}^{(n+1)} - \mathbf{D}\mathbf{x}^{(n)} + \underbrace{\mathbf{D}\mathbf{x}^{(n)} + (\mathbf{L} + \mathbf{U})\mathbf{x}^{(n)}}_{\mathbf{Ax}^{(n)}} = \mathbf{b}$$

$$\Rightarrow \quad \mathbf{P} = \mathbf{D} \text{ and } \tau = 1$$

Seidel iteration

$$(\mathbf{D} + \mathbf{L})\mathbf{x}^{(n+1)} - (\mathbf{D} + \mathbf{L})\mathbf{x}^{(n)} + \underbrace{(\mathbf{D} + \mathbf{L})\mathbf{x}^{(n)} + \mathbf{U}\mathbf{x}^{(n)}}_{\mathbf{Ax}^{(n)}} = \mathbf{b}$$

$$\Rightarrow \quad \mathbf{P} = \mathbf{D} + \mathbf{L}, \text{ and } \tau = 1$$

Canonical form of iterative methods

S.O.R.

$$\mathbf{P} = \mathbf{D} + \omega \mathbf{L}, \text{ and } \tau = \omega$$

Convergence analysis of iterative methods

If iterations converge, then $\mathbf{x}^{(n)} \rightarrow \hat{\mathbf{x}}$, the solution of $\mathbf{Ax} = \mathbf{b}$

Convergence analysis of iterative methods

If iterations converge, then $\mathbf{x}^{(n)} \rightarrow \hat{\mathbf{x}}$, the solution of $\mathbf{Ax} = \mathbf{b}$

Define

$$\mathbf{e}^{(n)} = \mathbf{x}^{(n)} - \hat{\mathbf{x}}$$

Then, iterations are

$$\mathbf{e}^{(n+1)} = \mathbf{S}_{n+1} \mathbf{e}^{(n)}$$

where the *transition matrix*

$$\mathbf{S}_{n+1} = \mathbf{I} - \tau_{n+1} \mathbf{P}_{n+1}^{-1} \mathbf{A}$$

Convergence analysis of iterative methods

For symmetric positive definite \mathbf{A} , a stationary iteration ($\mathbf{S}_n = \mathbf{S}$) converges if and only if

$$\rho(\mathbf{S}) < 1$$

where $\rho(\mathbf{S}) = \max_{1 \leq j \leq m} |\lambda_j|$

Variational approaches

Let $\hat{\mathbf{x}}$ is the solution of $\mathbf{A}\hat{\mathbf{x}} = \mathbf{b}$.

Consider

$$\frac{\mathbf{x}_{n+1} - \mathbf{x}_n}{\tau_{n+1}} + \mathbf{A}\mathbf{x}_n = \mathbf{b}$$

The main idea

Choose τ_{n+1} to minimize $\|\mathbf{x}_{n+1} - \hat{\mathbf{x}}\|$ given $\|\mathbf{x}_n - \hat{\mathbf{x}}\|$.

Variational approaches

Let $\hat{\mathbf{x}}$ is the solution of $\mathbf{A}\hat{\mathbf{x}} = \mathbf{b}$.

Consider

$$\frac{\mathbf{x}_{n+1} - \mathbf{x}_n}{\tau_{n+1}} + \mathbf{A}\mathbf{x}_n = \mathbf{b}$$

The main idea

Choose τ_{n+1} to minimize $\|\mathbf{x}_{n+1} - \hat{\mathbf{x}}\|$ given $\|\mathbf{x}_n - \hat{\mathbf{x}}\|$.

Alternatively, minimize the *residual* $\mathbf{r}_n = \mathbf{A}\mathbf{x}_n - \mathbf{b}$:

$$\|\mathbf{r}_{n+1}\| \Rightarrow \min \quad \text{given } \|\mathbf{r}_n\|$$

Minimum residual method

Rewrite the iteration as

$$\mathbf{x}_{n+1} = \mathbf{x}_n - \tau_{n+1} \mathbf{r}_n$$

Multiply by \mathbf{A} and subtract \mathbf{b} :

$$\mathbf{r}_{n+1} = \mathbf{r}_n - \tau_{n+1} \mathbf{A} \mathbf{r}_n$$

Minimize the 2-norm of \mathbf{r}_{n+1} :

$$\begin{aligned} \|\mathbf{r}_{n+1}\|^2 &= \|\mathbf{r}_n - \tau_{n+1} \mathbf{A} \mathbf{r}_n\|^2 \\ &= \|\mathbf{r}_n\|^2 + \tau_{n+1}^2 \|\mathbf{A} \mathbf{r}_n\|^2 - 2\tau_{n+1} \langle \mathbf{r}_n \cdot \mathbf{A} \mathbf{r}_n \rangle \end{aligned}$$

Minimum residual method

So that the n -th iteration of the algorithm is

1. Compute $\mathbf{r}_n = \mathbf{A}\mathbf{x}_n - \mathbf{b}$
2. Compute

$$\tau_{n+1} = \frac{\langle \mathbf{r}_n \cdot \mathbf{A}\mathbf{r}_n \rangle}{\|\mathbf{A}\mathbf{r}_n\|^2}$$

3. Compute $\mathbf{x}_{n+1} = \mathbf{x}_n - \tau_{n+1}\mathbf{r}_n$
